Manas Rai

Data Analyst | SQL • Power BI • Python • Data Validation • Reconciliation • GenAI
Ghaziabad, Uttar Pradesh, India | mrai73759@gmail.com | linkedin.com/in/manasrai1406

EDUCATION

Dr. APJ Abdul Kalam Technical University (AKTU) – KIET Group of Institutions Nov 2021 – Jul 2025
Bachelor of Technology, Computer Science – CGPA: 8.3 *Ghaziabad, India*

Central Board of Secondary Education (CBSE) Apr 2019 – Apr 2020
Intermediate – 91.20% *Varanasi, India*

SKILLS

Data Analysis & Querying: SQL, MySQL, PostgreSQL, Microsoft Excel, Python, pandas, Data Validation, Data Reconciliation
Reporting & BI: Power BI, Dashboards, Dell Boomi, REST APIs, BI Security Setup, Data Accuracy Monitoring
Machine Learning & AI: Python, Machine Learning, Deep Learning, NLP, Text Embeddings, Prompt Engineering, GenAI / LLM APIs, OCR, AI-assisted Workflow Automation
Tools: Power BI, Dell Boomi, Jira, Salesforce, UKG Pro, MySQL, XML, Microsoft Excel

WORK EXPERIENCE

Ultimate Kronos Group (UKG) Feb 2025 – Present
Solution Consultant I, Customer Success & Onboarding *Noida, India*

- Designed and built a **Power BI productivity dashboard** for my org set, tracking productive vs. non-productive and billable vs. non-billable hours of **120+ employees** across projects and managers, giving managers visibility to allocate work; pulled data from the company **Timesheet API** via **Dell Boomi** integration and transformed it with **SQL**.
- Drove adoption by **5 managers** to guide work-allocation decisions, and the Director used it in team reviews, turning raw timesheet data into actionable insight for leadership.
- Applied **SQL and Microsoft Excel** to validate and reconcile payroll data across sources, improving turnaround time and reducing manual errors on wage and payroll comparison tasks.
- Ran routine **data quality checks** on key account health parameters, including data accuracy, BI security setup, support performance, and payroll cycle validation, and followed up on issues through to resolution.
- Standardized internal processes and shared data-backed customer context with Engineering and Support teams, translating business needs into actionable requirements.
- Configured payroll taxes, deductions, and EEO reporting to take **5+ customers** through go-live and their first payroll cycle, adhering to compliance controls and procedures.
- Tracked and resolved escalations, bugs, and feature requests to closure in Jira and Salesforce, working with cross-functional teams; communicated findings clearly to technical and non-technical stakeholders.

PROJECTS

Legacy Report Mapping – RAG-Based Matching Prototype In Progress – scaling with Engineering
Python, OpenAI (embeddings), Qdrant, PII Masking

- Built a **Retrieval-Augmented Generation (RAG) prototype** to automate matching of legacy client reports to their equivalent UKG Pro system reports, replacing a manual lookup across folders that took ~**1 hour per report** (longer for ambiguous/clashing cases).
- Masked PII in each single-page legacy report before generating embeddings via the **OpenAI API** and retrieving candidate matches with **Qdrant** vector search, surfacing the **top 5 likely matches** for review; used whole-report chunking since each report is a single page and matching is report-to-report, not sub-document.
- Piloted with **30 users**, cutting average mapping time to ~**10 minutes per report** (tickets typically span 12–14 reports); handed off to Engineering to scale for the **120-person** consulting team.

Parchi – GenAI-Assisted Receipt Management System github.com/manasrai1406/parchi
Python, pandas, OCR (PaddleOCR, OpenCV), PostgreSQL, Redis, GenAI / LLM APIs, FastAPI

- Built a data pipeline that converts unstructured receipts (PDF, Excel, CSV, scans, photos) into structured records (vendor, date, subtotal, GST, total) using **pandas, pdfplumber and OCR**, loaded into **PostgreSQL** with content-hash duplicate detection to catch repeat uploads.
- Added a quality check that catches receipts where the numbers don't add up correctly, flags them for a quick human look instead of silently accepting bad data, and keeps a record of every receipt processed so nothing goes missing.
- Added an AI-assisted step for harder or unclear receipts, plus a simple way to ask questions about the data in plain English instead of writing queries — with the AI step only used when needed, to keep results accurate and costs predictable.
- Processed uploads through a **Redis-backed background job queue** instead of handling everything in the request itself, so large batches of receipts extract and validate in the background without slowing down or blocking the app.

LEADERSHIP & ACHIEVEMENTS

- **Machine Learning Lead, GDSC KIET:** Mentored 100+ students, improving project success rates by 30%.
- **SprintHacks 2.0 Coordinator:** Led stakeholder coordination for a national hackathon (1 crore+ prize pool, 2,000+ attendees); Global Nominee, NASA Space Apps Challenge (200+ teams); 5+ total hackathon wins.
